# AGENDA

- Introduction talk (  $\leq 20$  mins )
- Live Coding (  $\leq 40$  mins )
- Workshop (  $\leq 120$  mins )

# INTRODUCTION TALK

- Before we begin be sure to have installed NodeJS
- If you haven't you can download it from:

<https://nodejs.org/en/>

# INTRODUCTION TALK

- The web
- Server-side rendering
- Client-side rendering
- APIs
- React

# HOW DOES THE WEB WORK TODAY?

verycool.com

# HOW DOES THE WEB WORK TODAY?

verycool.com

*Requests page*

*Returns the page*

# HOW DOES THE WEB WORK TODAY?

verycool.com

You are very cool!

# HOW DOES THE WEB WORK TODAY?

## Conclusion

- Client makes request
- Server responds
- Clients displays / uses the response

# SERVER-SIDE RENDERING

index.php

---

```
<html>
  <head><title>Very Cool</title></head>
  <body>
    <?php
      $mysqli = new mysqli("localhost", "my_user", "my_password", "world");

      $result = $mysqli->query("SELECT name FROM users WHERE username='johnyd'");

      echo 'You are very cool' . $result['name'];
    ?>
  </body>
</html>
```

# SERVER-SIDE RENDERING

# SERVER-SIDE RENDERING

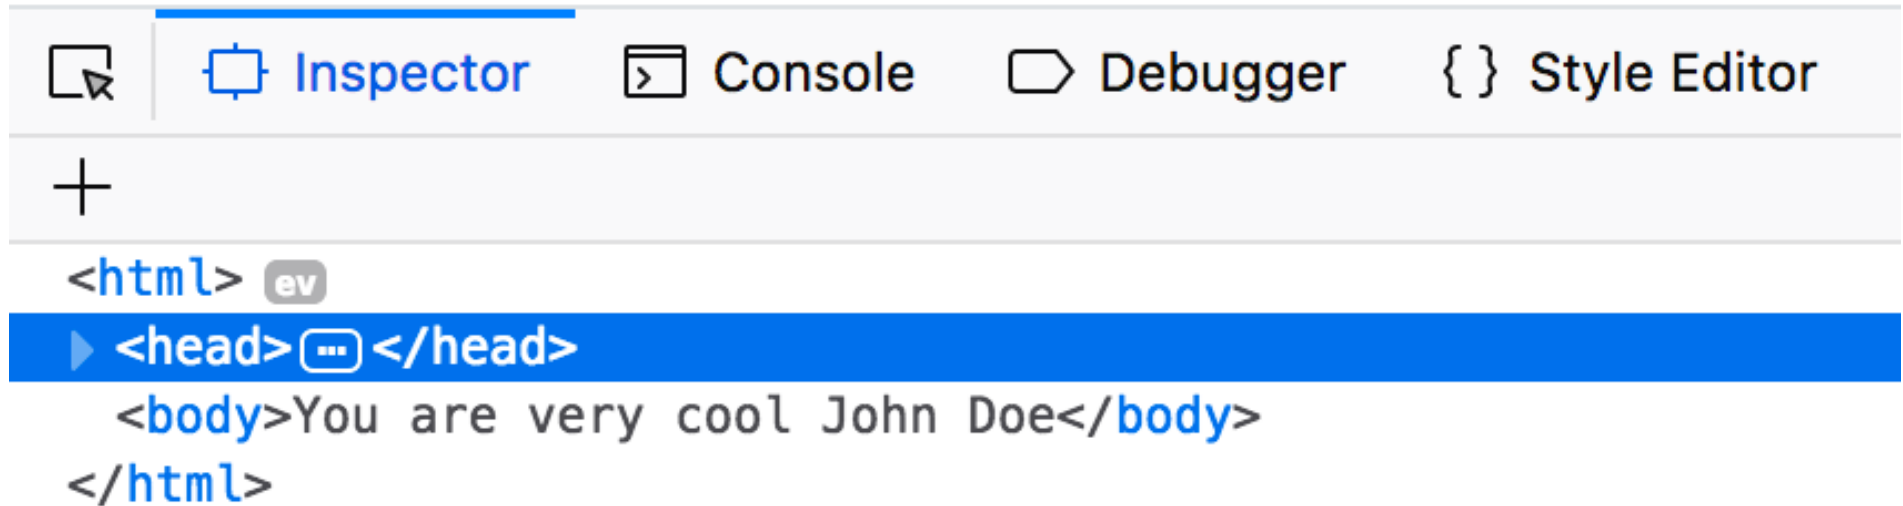

verycool.com

You are very cool John Doe

# SERVER-SIDE RENDERING

The screenshot shows a web browser's developer tools interface. At the top, there are tabs for 'Inspector', 'Console', 'Debugger', and 'Style Editor'. The 'Inspector' tab is active. Below the tabs, there is a '+' icon. The main area displays the HTML structure of a page. The root element is '<html>' with a small 'ev' icon next to it. Below it is the '<head>' element, which is highlighted with a blue background. To the right of '<head>' is a small icon with three dots. Below the '<head>' element is the '<body>' element, which contains the text 'You are very cool John Doe'. The '<body>' element is also highlighted with a blue background. Below the '<body>' element is the '</html>' closing tag.

```
<html> ev
  <head> ... </head>
    <body>You are very cool John Doe</body>
  </html>
```

But no PHP??

# SERVER-SIDE RENDERING

## Conclusion

- Server compiles the code on request
- Server returns the compiled page to the client
- Server has all the work

# CLIENT-SIDE RENDERING

index.html

```
<html>
  <head><title>Very Cool</title></head>
  <body>
    <div id="root"></div>
    <script src="bundle.js"></script>
  </body>
</html>
```

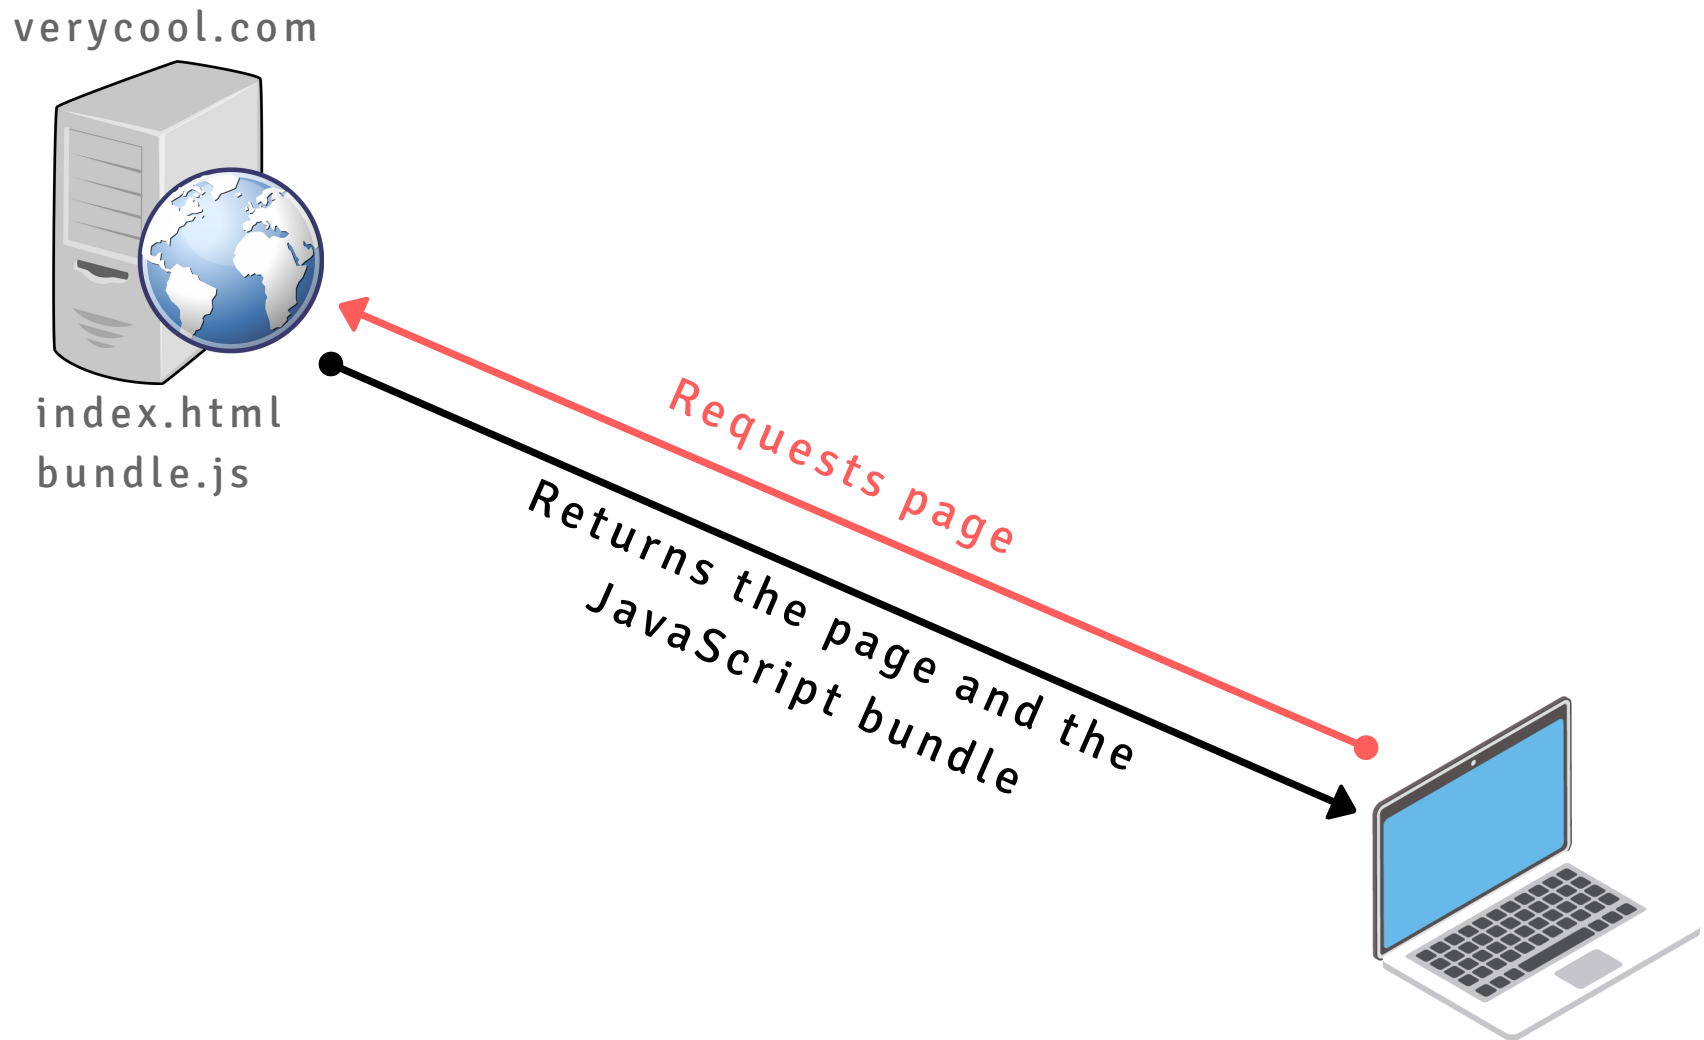

# CLIENT-SIDE RENDERING

bundle.js

```
fetch("http://api.com")  
  .then(response => response.json())  
  .then(name => document.getElementById("root").innerText = "You are very cool " + name);
```

# CLIENT-SIDE RENDERING

# CLIENT-SIDE RENDERING

verycool.com

index.html  
bundle.js

You are very cool John Doe

# CLIENT-SIDE RENDERING

## Conclusion

- Server only returns the HTML and JavaScript files
- Client renders the content through JavaScript
- Client has ( **almost** ) all the work
- Client needs a way to get dynamic data

# APIs

## Enter APIs

verycool.com

index.html  
bundle.js

api.com

The API could be  
in the same  
server as the  
web app

# APIs

# APIs

verycool.com

index.html  
bundle.js

api.com

JavaScript bundle  
requests user name

Returns the user name

# APIs

verycool.com

index.html  
bundle.js

api.com

JavaScript bundle then  
renders the user name

You are very cool John Doe

# APIs

## Conclusion

- APIs are programs running in servers which return content in the form of text, JSON, etc
- Can be called from any device
- Highly reusable
- Perfect for client-side rendering

# REACT

Browser APIs are complex and this made client-side rendering a bit too difficult to handle, for this reason a couple of JavaScript libraries started to appear and solve some of these problems.

A good and common used example is jQuery

*jQuery is a fast, small, and feature-rich JavaScript library (...) with an easy-to-use API that works across a multitude of browsers.*

Source: [jQuery.com](https://jquery.com)

# REACT

## Where does React fit in all this?

*React is a JavaScript library for building user interfaces. It is maintained by Facebook, Instagram and a community of individual developers and corporations.*

*React allows developers to create large web-applications that use data and can change over time without reloading the page. It aims primarily to provide speed, simplicity, and scalability.*

Source: wikipedia

# REACT

## React makes use of JSX

*JSX is a syntax extension to JavaScript to describe what the UI should look like, it might sort of resemble a template language, but it comes with the full power of JavaScript. It is **faster**, **safer** and **easier**!*

```
|  
const element = <h1>Hello, world!</h1>;
```

*React embraces the fact that rendering logic is inherently coupled with other UI logic (event handling, state changes, data preparation). Instead of artificially separating concerns in different files, React separates concerns with loosely coupled units called “components” that contain both rendering logic as UI logic.*

# REACT

## Conclusion

- JavaScript library
- Renders in client-side
- Fast, simple and scalable
- Makes use of JSX

# LIVE CODING - WEB CHAT

Start by opening a terminal and typing:

```
$ npm install -g create-react-app
```

I recommend you to follow the live coding session, but all the code created during it is available at:

<https://github.com/GJordao/react-workshop-ipbeja>

Simply clone or download the repository, open a terminal window inside its location and type:

```
$ npm install
```

```
$ npm start
```
